

Abstract

[0031] A doll that includes a pair legs pivotally attached to a torso. The torso having a front side and backside. A pair of motor mechanisms separately attached to each leg for pivoting the legs forwards and backwards in accordance to a set of pre-programmed positions that moves the doll from a first orientation to a second orientation. The movement may be defined as rolling the doll from its front side to its backside and vice versa, as well as moving the doll to a standing position and walking the doll while it is standing.
